MONITORING OF GLYCOSYLATION ANALYTICAL APPROACHES FOR ANTIBODY-BASED THERAPEUTICS

An introduction to N-linked glycosylation and available approaches for characterization.

N-linked glycosylation is a common post-translational modification on many antibody-based therapeutics, and has been linked to safety, stability and activity. Glycosylation should therefore be monitored and controlled.

In this white paper, our expert Michael Walker discusses complementary N-linked glycosylation characterization techniques that give relative levels of different glycoforms at specific sites and compares them to more common methodologies of enzymatic stripping and fluorescent labelling.
