

ButiRect® Suppositories

- Targeted **local regenerative** therapy for **damaged rectal mucosa**.
- Relief of **painful symptoms** caused by mucosal **damage** or **inflammatory processes** in the rectum.
- **Protection, hydration** and **regeneration** of the rectal mucosa.

ButiRect® suppositories are intended for rectal use.

Local use of ButiRect® suppositories provides:

- **Supports the regeneration** of erosions, fissures or other damage of the **rectal mucosa**.
- **Relief of painful bowel** movement symptoms **associated with** epithelial damage or **inflammatory processes** in the rectum.
- **Support for the regeneration** of anal canal tissue **after surgery** or **radiotherapy**.
- **Restoration of the natural** physiological condition of the rectal mucosa.
- **ButiRect®** is a medical device **containing sodium butyrate** in a polysaccharide sodium alginate matrix.
- **Sodium butyrate**, an epithelial nutrient, **supports mucosal regeneration** and **reduction of inflammation**.
- **ButiRect®** suppositories with sodium butyrate, sodium alginate and carboxymethylcellulose **represent a new concept of targeted regenerative therapy** aimed at epithelial restoration and relief of local irritation.
In contact with mucus, **ButiRect®** **creates mechanical protective layers** on the mucosal surface. The protective layers shield the mucosa and improve rectal hydration.
- **Modern approach** to local **regenerative therapy**

Combination of biologically active substances and the protective matrix achieves a synergistic effect:

- ✓ Symptom relief
- ✓ Stimulation of mucosa repair
- ✓ Improvement in patients' quality of life
